                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gel. First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pXX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is AGCGAGACAG. This library was created for the University lows Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D., program coordinator."

This invention describes a novel method for the quantitation of tumour cells in a body fluid which comprises (1) enrichment or isolation of tumour cells in the sample, (2) amplification of mRNA from these cells that encodes the catalytic subunit of telomerase and (3) quantifying the amount of amplified mRNA. The method is applied to tumour cells derived from (micro)metastases, e.g. associated with a wide range of tumours such as T-cell lymphoblastoma, chronic myeloid or acute lymphatic leukemia,

pulmonary carcinoma, cancer of colon or breast etc.

Example; Fig 1A-B; 26pp; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This is the nucleotide sequence of cDNA encoding human telomerase reverse transcriptase (hTRT, see ANY32090). Human telomerase is a target for diagnosting and treating diseases relating to cell proliferation and senescence, such as cancer, or for increasing the proliferative capacity of a cell. A claimed method for increasing the proliferative capacity of a vertebrate cell, especially a human or other mammalian cell, involves introducing into the cell a recombinant hTRT polymucleotide encoding an hTRT variant in which residues 192-323, 200-323, 192-271, 200-271, 222-240, 415-450, 192-323 and 415-450, or 192-271 and 415-450 are deleted. A claimed method for reducing telomerase activity in a cell involves introducing a recombinant polymucleotide encoding an hTRT variant having a deletion of amino acids 192-450, 560-565, 637-660, 638-660, 748-764 or 1055-1071. The polymucleotides are obtained by mutagenesis of the hTRT coding an encoder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cbs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New catalytic polypeptide and polynucleotide, useful catalytic activity in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-MAR-1998;

CDS
The present sequence encodes a human telomerase reverse transcriptase (TRT) polypeptide. The protein is used in the method of the invention. The specification describes a method for activating a Tlymphocyte, comprising contacting the Tlymphocyte with a dendritic cell that expresses a TRT peptide in the context of a MHC class I or MHC class I molecule. The protein causes induction of an in vivo immunological response to telomerase activity. Cancer cells are characterized by expression of endogenous TRT gene and the presence of detectable telomerase activity. Therefore, by eliciting a specific immune respons

The method is eliciting an in vivo immune response to telomerase by activating lymphocyte, and is useful for prevention and treatment of cancers other proliferation diseases/conditions

The method is useful for detecting the presence of beta-region (a 182 nucleotide region consisting of exons 7 and 8) of the hTERT-mRNA in a human sample for diagnosis and prognosis of cancer. The method provides an accurate measure of telomerase activity by selectively measuring mRNA that encodes an active hTERT protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Quantitating expression of mRNA encoding hTERT, the catalytic subunit of telomerase, as an indicator of cancer, by amplifying RNA using primers complementary to hTERT gene sequence and quantitating amplified products

                                                                                                                                                  The invention relates to animal tissues with carbohydrate antigens that are compatible for transplantation into human patients. The mammalian cell is inactivated homozygously for expression of alpha(,3)galactosyltransferase (alpha1,3GT) gene and comprises a transgene for alpha(1,2)-fucosyltransferase (alpha1,2FT). It is useful for producing animal tissue with carbohydrate antigens that are compatible for transplantation into human patients. The present sequence is human telomerase reverse transcriptase (TERT) cDNA used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2002-759895/82.

```
Discrimination of a cancer cell in a sample tissue, comprises determining the expression level of a reverse transcriptase component of telomerase using a hybridization assay.
```

Claim 2; Page 9-10; 16pp; Japanese

The present invention relates to a method for the discrimination of a cancer cell in a sample tissue, which involves determining the expression level of a reverse transcriptase component of telomerase in a cell constituting the sample tissue by an in situ hybridization of the mRNA of the enzyme, and judging a cell showing a higher expression level than that of the reverse transcriptase component of telomerase in a normal cell to be a cancer cell. The present sequence is a human DNA used in the exemplification of the invention

The present sequence is that of human telomerase reverse transcriptase (TERT) cDNA. The invention relates to the discovery that double-stranded interfering RNAs, such as short interfering RNAs (SiRNA), which target telomerase RNA or TERT mRNA are capable of inhibiting telomerase activity. Inhibition of telomerase in cancer cells leads to telomerase shortening, end-to-end chromosomal fusion, and apoptosis. Interference of telomerase activity can also be used for treatment of infertility, for contraception or sterilisation, for immunosuppression, for treatment of yeast, parasite and fungal infections, and in antiinflammatory therapies. As telomerase is active in a limited number of cell types, e.g. tumour cells, germline cells, certain stem cells of the haematopoietic system. T and B cells, sun-damaged skin, and proliferative cervix, most normal cells are not affected by telomerase RNA interference therapy

(I) has vulnerary and antiulcer activities and can be used to promote epithelial cell migration. (I) is useful for treating a wound and enhancing epithelisation of a skin surface. The wound is especially skin wound including acute lesion such as traumatic lesion, burn, or surgical incision, chronic lesion such as chronic venous ulcer, diabetic ulcer or compression ulcer and the wound is further monitored for closure. The telomerase activity or TERT expression is increased in epithelial cells at the site of treatment and also in fibroblasts or endothelial cells at the site of treatment. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         epithelial cells are especially keratinocytes. A polynucleotide encoding TERT is useful for the preparation of a medicament for treatment of a wound or an epithelial surface in a human or animal. An epithelial cell with increased telomerase activity or increased expression of TERT is useful for preparation of a medicament for the treatment of a wound in a human or animal. (I) is also useful for treating wounds of other apidermal surfaces including mucosal surfaces such as bronchus, mouth, nose, oesophagus, stomach, or intestine. The present sequence encodes human TERT (hTERT), which is given in the exemplification of the present invention. hTERT is located to chromosome 5

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
The invention relates to the generation of primary preadipocyte cell strains that expresse telomerase reverse transcriptase (TEXT the catalytic subunit of telomerase), and maintain and/or enhance replicative potential and maintain adipogenic capacity of the cell. This sequence represents the gene encoding the TERT protein. The cell strain can be used in research to study all aspect of adipogenesis, especially in relation to researching treatments for e.g. obesity. The cell can also be used to identify adipogenesis modulators for use as therapeutic agents
                                                                                                                    New primary preadipocyte strain expressing telomerase reverse transcriptase, useful in research applications, screening assays, clinical applications, and in the administration of therapeutic a particularly for obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                       Gene; ds; human; telomerase reverse transcriptase; primary preadipocyte cell; adipogenesis; obesity; anorectic; adiponectin; insulin.

Novel double-stranded short interfering RNA having sense and antisense nucleic acids which are complementary to each other and to target nucle acid e.g., telomerase RNA or mRNA encoding telomerase reverse transcriptase. target nucleic

Disclosure; Fig 3A-B; 37pp; English.

The present sequence is that of human telomerase reverse transcriptase (TERT) cDNA. The invention relates to the discovery that double-stranded interfering RNAs, such as short interfering RNAs (siRNA), which target telomerase RNA or TERT mRNA are capable of inhibiting telomerase activity. Inhibition of telomerase in cancer cells leads to telomerae shortening, end-to-end chromosomal fusion, and apoptosis. Interference of telomerase activity can also be used for treatment of infertility, for contraception or sterilisation, for immunosuppression, for treatment of yeast, parasite and fungal infections, and in antiinflammatory therapies. As telomerase is active in a limited number of cell types, e.g. tumour cells, germline cells, certain stem cells of the haematopoietic system, T and B cells, sun-damaged skin, and proliferative cervix, most normal cells are not affected by telomerase RNA interference therapy
